

RNA vaccines, nanoparticles, and the 'new and improved' Kennedy vaccine advisory committee

JON RAPPOPORT
JUL 17, 2025 • PAID

(This is Part-4; for Part-3, [go here](#))

I've been writing about the inherent threat of nanotechnology for some time now.

So I've been waiting to hear something from Kennedy's new vaccine committee because all RNA vaccines ARE COMPOSED OF THESE TINY NANOPARTICLES.

So far, silence.

In fact, the FDA [recently approved](#) a new RNA COVID vaccine. A very bad sign.

The warnings about nanotech have been there for many years. For instance:

Politico, May 23, 2005: "Scientists believe the tiny particles could pose safety concerns when inhaled. 'Usually larger particles get cleared out; we swallow, sneeze or cough them out,' said Andrew Maynard of NIOSH [CDC]. 'Small particles may penetrate the walls of the lung and get into the blood.'"

—How about when the tiny particles are INJECTED??

Here's how the mainstream game works. In one sector of the research community, scientists are shaking their heads and seeing the MAJOR safety problems with

nanoparticles.

In another sector, researchers are coming up with one RNA nanoparticle vaccine, another.

The two sectors don't talk to each other.

And who is Robert Kennedy talking to these days?

Anybody? In 2020, he was talking to the whole world about the nanoparticles in COVID shots.

He had a lot of say about the coatings on the nanoparticles. It wasn't complimentary.

Why isn't he voicing those concerns, *with all his official power*, now?

Here is what Kennedy wrote at Children's Health Defense on December 10, 2020:

Letter from RFK Jr. on concerns with Moderna's COVID vaccine ([link](#))

“Moderna’s mRNA vaccine, which has rapidly moved into human clinical trial on a new nanoparticle-based ‘carrier system’ that utilizes polyethylene glycol (PEG). The lipid nanoparticles (LNPs) in the Moderna vaccine are coated with the synthetic, nondegradable and increasingly controversial PEG polymer in a process called PEGylation.”

“PEG is utilized in drug delivery and nanotechnology due to its reported ‘stealth’ properties and alleged biocompatibility. In recent years, however, PEG has come under increasing scrutiny. Investigators who once assumed that the polymer was largely ‘inert’ are now questioning its biocompatibility and warning about PEGylated particles’ promotion of tumor growth and adverse immune responses that include ‘probably underdiagnosed’ life threatening anaphylaxis...”

—But now, in 2025, no problem? COVID vaccines can remain available? They
A brand new one is OK?

Tumor growth and life-threatening anaphylaxis are OK?

Speak up, Bob. I can't hear you.

You cannot ignore that the depopulation agenda is alive and well and perhaps about to There is not ONE freaking thing Trump or RFK has done to suggest otherwise. Nada, zi

RFK isn't tackling tough issues, Trump isn't releasing files, it just seems as we take one forward, FOUR feet back.

Regarding nanotechnology, I'm starting to think it's a lot like "virology" and "quantum c sounds good, but not realistic:
