I don't trust that study. In Australia, South Australian senator Alex Antic did a FOI request (November 2022) for 15-44-year olds. This information revealed that cardiac presentations month were steady at 1000 per month, month on month. When the mandated vaxx rollout there was an immediate jump in cardiac presentations to 2100 per month (an extra 35 per cent). S.A is roughly 10% of the Australian population (approx 26 million), and the mandates were synchronised for all states, that would indicate an additional 350 additional people per day (annualised) required treatment for a cardiac condition. Whilst this is a broader age group above study, it does make one ask if the study is biased. There was a study in Thailand where injected kids had elevated troponin levels, which is an indicator of heart damage. How many people got chest pains or other signs that were never reported? I am aware of a number of health impacts such as blood clots and cardiac problems and noticed a marked increase in the number of family, friends and workers etc which died since the coerced injections. The number of deaths since the mandates ended have not dropped much, indicating there is an ongoing disaster linked to these mRNA bioweapon jabs. In my opinion, there is no way in hell these deaths are as minimal as this report makes out.

So, what are the parents of these children going to do about it? What are WE going to do

I don't know -the outlook is grim:

"Treatment remains supportive as no specific treatment for biopsy-proven myocarditis has been shown to be effective in randomized controlled trials. The outcomes of patients with myocarditis span the entire spectrum from complete recovery, development of dilated cardiomyopathy, the need for heart transplantation, and death."

"Myocarditis has been implicated in sudden death of young adults in 8–12% of cases; 10–12% of cases. The gold standard for the diagnosis of myocarditis is still the endomyocardial biopsy. Mortality for biopsy-verified lymphocytic myocarditis averages 20% at 1 year and 50% at 4 years. The survival rates are similar to observational data for patients with dilated cardiomyopathy. Survival with giant cell myocarditis is substantially lower with only 20% of patients surviving 5 years."

Justice is due. We may not be able to make things right for these injured children, but they should be able to mete out justice to those who are responsible. Justice will not come, however, until enough people are outraged.

You forgot the baby eating part. Killing babies is definitely on brand for the lot, and it's just separation. Where is the outrage on any of this???? This walking-dead dull stupor is mind The house is burning and the children are still inside.
